TITLE OF THE INVENTION
SPIRO-SUBSTITUTED AZACYCLES AS MODULATORS OF CHEMOKINE RECEPTOR ACTIVITY

BACKGROUND OF THE INVENTION

Chemokines are chemotactic cytokines that are released by a wide variety of cells to attract macrophages, T cells, eosinophils, basophils and neutrophils to sites of inflammation (reviewed in Schall, Cytokine, 3, 165-183 (1991) and Murphy, Rev. Immun., 12, 593-633 (1994)). There are two classes of chemokines, C-X-C (α) and C-C (β), depending on whether the first two cysteines are separated by a single amino acid (C-X-C) or are adjacent (C-C). The α-chemokines, such as interleukin-8 (IL-8), neutrophil-activating protein-2 (NAP-2) and melanoma growth stimulatory activity protein (MGSA) are chemotactic primarily for neutrophils, whereas β-chemokines, such as RANTES, MIP-1α, MIP-1β , monocyte chemotactic protein-1 (MCP-1), MCP-2, MCP-3 and eotaxin are chemotactic for macrophages, T-cells, eosinophils and basophils (Deng, et al., Nature, 381, 661-666 (1996)).

The chemokines bind specific cell-surface receptors belonging to the family of G-protein-coupled seven-transmembrane-domain proteins (reviewed in Horuk, Trends Pharm. Sci., 15, 159-165 (1994)) which are termed "chemokine receptors." On binding their cognate ligands, chemokine receptors transduce an intracellular signal though the associated trimeric G protein, resulting in a rapid increase in intracellular calcium concentration. There are at least seven human chemokine receptors that bind or respond to β-chemokines with the following characteristic pattern: CCR-1 (or "CKR-1" or "CC-CKR-1") [MIP-1α, MIP-1β, MCP-3, RANTES] (Ben-Barruch, et al., J. Biol. Chem., 270, 22123-22128 (1995); Beote, et al, Cell, 72, 415-425 (1993)); CCR-2A and CCR-2B (or "CKR-2A"/"CKR-2A" or "CC-CKR-2A"/"CC-CKR-2A") [MCP-1, MCP-3, MCP-4]; CCR-3 (or "CKR-3" or "CC-CKR-3") [eotaxin, RANTES, MCP-3] (Combadiere, et al., J. Biol. Chem., 270, 16491-16494 (1995); CCR-4 (or "CKR-4" or "CC-CKR-4") [MIP-1α, RANTES, MCP-1] (Power, et al., J. Biol. Chem., 270, 19495-19500 (1995)); CCR-5 (or "CKR-5" or "CC-CKR-5") [MIP-1α, RANTES, MIP-1β]

(Sanson, et al., Biochemistry, 35, 3362-3367 (1996)); and the Duffy blood-group antigen [RANTES, MCP-1] (Chaudhun, et al., J. Biol. Chem., 269, 7835-7838 (1994)). The β-chemokines include eotaxin, MIP ("macrophage inflammatory protein"), MCP ("monocyte chemoattractant protein") and RANTES ("regulation-upon-activation, normal T expressed and secreted").

Chemokine receptors, such as CCR-1, CCR-2, CCR-2A, CCR-2B, CCR-3, CCR-4, CCR-5, CXCR-3, CXCR-4, have been implicated as being important mediators of inflammatory and immunoregulatory disorders and diseases, including asthma and allergic diseases, as well as autoimmune pathologies such as rheumatoid arthritis and atherosclerosis. For example, the chemokine receptor CCR-3 plays a pivotal role in attracting eosinophils to sites of allergic inflammation. Accordingly, agents which modulate chemokine receptors would be useful in such disorders and diseases.

A retrovirus designated human immunodeficiency virus (HIV-1) is the etiological agent of the complex disease that includes progressive destruction of the immune system (acquired immune deficiency syndrome; AIDS) and degeneration of the central and peripheral nervous system. This virus was previously known as LAV, HTLV-III, or ARV.

Certain compounds have been demonstrated to inhibit the replication of HIV, including soluble CD4 protein and synthetic derivatives (Smith, et al., Science, 238, 1704-1707 (1987)), dextran sulfate, the dyes Direct Yellow 50, Evans Blue, and certain azo dyes (U.S. Patent No. 5,468,469). Some of these antiviral agents have been shown to act by blocking the binding of gp120, the coat protein of HIV, to its target, the CD4 gyycoprotein of the cell.

Entry of HIV-1 into a target cell requires cell-surface CD4 and additional host cell cofactors. Fusin has been identified as a cofactor required for infection with virus adapted for growth in transformed T-cells, however, fusin does not promote entry of macrophagetropic viruses which are believed to be the key pathogenic strains of HIV in vivo. It has recently been recognized that for efficient entry into target cells, human immunodeficiency viruses require the chemokine

receptors CCR-5 and CXCR-4, as well as the primary receptor CD4 (Levy, N. Engl. J. Med., 335(20), 1528-1530 (Nov. 14 1996). The principal cofactor for entry mediated by the envelope glycoproteins of primary macrophage-trophic strains of HIV-1 is CCR5, a receptor for the β-chemokines RANTES, MIP-1α and MIP-1β (Deng, et al., Nature, 381, 661-666 (1996)). HIV attaches to the CD4 molecule on cells through a region of its envelope protein, gp120. It is believed that the CD-4 binding site on the gp120 of HIV interacts with the CD4 molecule on the cell surface, and undergoes conformational changes which allow it to bind to another cell-surface receptor, such as CCR5 and/or CXCR-4. This brings the viral envelope closer to the cell surface and allows interaction between gp41 on the viral envelope and a fusion domain on the cell surface, fusion with the cell membrane, and entry of the viral core into the cell. Macrophage-tropic HIV and SIV envelope proteins have been shown to induce a signal through CCR-5 on CD4+ cells resulting in chemotaxis of T cells which may enhance the replication of the virus (Weissman, et al., Nature, 389, 981-985 (1997)). It has been shown that β-chemokine ligands prevent HIV-1 from fusing with the cell (Dragic, et al., Nature, 381, 667-673 (1996)). It has further been demonstrated that a complex of gp120 and soluble CD4 interacts specifically with CCR-5 and inhibits the binding of the natural CCR-5 ligands MIP-1α and MIP-1β (Wu, et al., Nature, 384, 179-183 (1996); Trkola, et al., Nature, 384, 184-187 (1996)).

Humans who are homozygous for mutant CCR-5 receptors which do not serve as co-receptors for HIV-1 in vitro apper to be unusually resistant to HIV-1 infection and are not immuno-compromised by the presence of this genetic variant (Nature, 382, 722-725 (1996)). Similarly, an alteration in the CCR-2 gene, CCR2-641, can prevent the onset of full-blown AIDS (Smith, et al., Science, 277, 959-965 (1997). Absence of CCR-5 appears to confer protection from HIV-1 infection (Nature, 382, 668-669 (1996)). An inherited mutation in the gene for CCR5, Delta 32, has been shown to abolish functional expression of the gene and individuals homozygous for the mutation are apparently not susceptible to HIV infection. Other chemokine receptors may be used by some strains of HIV-1 or may be favored by non-sexual routes of

transmission. Although most HIV-1 isolates studied to date utilize CCR-5 or fusin, some can use both as well as the related CCR-2B and CCR-3 as co-receptors (Nature Medicine, 2(11), 1240-1243 (1996)). Nevertheless, drugs targeting chemokine receptors may not be unduly compromised by the genetic diversity of HIV-1 (Zhang, et al., Nature, 383, 768 (1996)). The β-chemokine macrophage-derived chemokine (MDC) has been shown to inhibit HIV-1 infection (Pal, et al., Science, 278 (5338), 695-698 (1997). The chemokines RANTES, MIP-1α, MIP-1β, vMIP-I, vMIP-II, SDF-1 have also been shown to suppress HIV. A derivative of RANTES, (AOP)-RANTES, is a subnanomolar antagonist of CCR-5 function in monocytes (Simmons, et al., Science, 276, 276-279 (1997)). Monoclonal antibodies to CCR-5 have been reported to block infection of cells by HIV in vitro. Accordingly, an agent which could block chemokine receptors in humans who possess normal chemokine receptors should prevent infection in healthy individuals and slow or halt viral progression in infected patients (see Science, 275, 1261-1264 (1997)). By focusing on the host's cellular immune response to HIV infection, better therapies towards all subtypes of HIV may be provided. These results indicate that inhibition of chemokine receptors presents a viable method for the prevention or treatment of infection by HIV and the prevention or treatment of AIDS.

The peptides eotaxin, RANTES, MIP-1α, MIP-1β, MCP-1, and MCP-3 are known to bind to chemokine receptors. As noted above, the inhibitors of HIV-1 replication present in supernatants of CD8+ T cells have been characterized as the β-chemokines RANTES, MIP-1α and MIP-1β. PCT Patent Publications WO 94/17045 (published August 4, 1994), WO 94/29309 (published December 22, 1994), and WO 96/10568 (published April 11, 1996) disclose certain azacycles as tachykinin antagonists.

The subject compounds are useful in a method of modulating chemokine receptor activity in a patient in need of such modulation comprising the administration of an effective amount of the compound.

The present invention is directed to the use of the foregoing spiro-substituted azacycles as modulators of chemokine receptor activity. In particular, these compounds are useful as modulators of the chemokine receptors, including CCR-1, CCR-2, CCR-2A, CCR-2B, CCR-3, CCR-4, CCR-5, CXCR-3, and/or CXCR-4. In particular, the compounds of the present invention are preferred as modulators of the chemokine receptor CCR-5.

The present invention is further directed to the use of compounds of this general structure which are disclosed as being antagonists of neurokinin receptors. Such compounds are disclosed, for example, in: U.S. Patent No. 5,317,020; U.S. Patent No. 5,534,525; U.S. Patent No. 5,350,852; U.S. Patent No. 5,411,971; U.S. Patent No. 5,446,052; U.S. Patent No. 5,560,700; EP 0 559 538, Sep. 8, 1993; EP 0 591 040, Apr. 6, 1994; EP 0 698 601, Feb. 28, 1996; EP 0 625 509, Nov. 23, 1994; EP 0 630 887, Dec. 28, 1994; EP 0 680 962, Nov. 8, 1995; EP 0 709 375, May 1, 1996; EP 0 709 376, May 1, 1996; EP 0 723 959, Jul. 31, 1996; EP 0 739 891; WO 94/10146, May 11, 1994; WO 94/17045, Aug. 4, 1994; WO 94/26735, Nov. 24, 1994; WO 94/29309, Dec. 22, 1994; WO 95/05377, Feb. 23, 1995; WO 95/12577, May 11, 1995; WO 95/15961, Jun. 15, 1995; WO 95/16682, Jun. 22, 1995; WO 95/21187; WO 95/26335, Oct. 5, 1995; WO 95/26338, Oct. 5, 1995; WO 95/35279; WO 96/06094, Feb. 29, 1996; WO 96/10568, Apr. 11, 1996; WO 96/23787, Aug. 8, 1996; WO 96/24582, Aug. 15, 1996; WO 96/28441; and WO 96/32385. Accordingly, the present invention embraces the use of a compound disclosed in these publications as a modulator of chemokine receptor activity.

The utility of the compounds in accordance with the present invention as modulators of chemokine receptor activity may be demonstrated by methodology known in the art, such as the assay for CCR-1 and/or CCR-5 binding as disclosed by Van Riper, et al., J. Exp. Med., 177, 851-856 (1993), and the assay for CCR-2 and/or CCR-3 binding as disclosed by Daugherty, et al., J. Exp. Med., 183, 2349-2354 (1996). Cell

lines for expressing the receptor of interest include those naturally expressing the receptor, such as EOL-3 or THP-1, or a cell engineered to express a recombinant receptor, such as CHO, RBL-2H3, HEK-293. For example, a CCR3 transfected AML14.3D10 cell line has been placed on restricted deposit with American Type Culture Collection in Rockville, Maryland as ATCC No. CRL-12079, on April 5, 1996. The utility of the compounds in accordance with the present invention as inhibitors of the spread of HIV infection in cells may be demonstrated by methodology known in the art, such as the HIV quantitation assay disclosed by Nunberg, et al., J. Virology, 65 (9), 4887-4892 (1991).

In particular, the compounds of the following examples had activity in binding to either the CCR-5 receptor or the CCR-3 receptor in the aforementioned assays. Such a result is indicative of the intrinsic activity of the compounds in use as modulators of chemokine receptor activity.

Mammalian chemokine receptors provide a target for interfering with or promoting eosinophil and/or lymphocyte function in a mammal, such as a human. Compounds which inhibit or promote chemokine receptor function, are particularly useful for modulating eosinophil and/or lymphocyte function for therapeutic purposes. Accordingly, the present invention is directed to compounds which are useful in the prevention and/or treatment of a wide variety of inflammatory and immunoregulatory disorders and diseases, including asthma and allergic diseases, as well as autoimmune pathologies such as rheumatoid arthritis and atherosclerosis.

For example, an instant compound which inhibits one or more functions of a mammalian chemokine receptor (e.g., a human chemokine receptor) may be administered to inhibit (i.e., reduce or prevent) inflammation. As a result, one or more inflammatory processes, such as leukocyte emigration, chemotaxis, exocytosis (e.g., of enzymes, histamine) or inflammatory mediator release, is inhibited. For example, eosinophilic infiltration to inflammatory sites (e.g., in asthma) can be inhibited according to the present method.

Similarly, an instant compound which promotes one or more functions of a mammalian chemokine receptor (e.g., a human

chemokine) is administered to stimulate (induce or enhance) an inflammatory response, such as leukocyte emigration, chemotaxis, exocytosis (e.g., of enzymes, histamine) or inflammatory mediator release, resulting in the beneficial stimulation of inflammatory processes. For example, eosinophils can be recruited to combat parasitic infections.

In addition to primates, such as humans, a variety of other mammals can be treated according to the method of the present invention. For instance, mammals including, but not limited to, cows, sheep, goats, horses, dogs, cats, guinea pigs, rats or other bovine, ovine, equine, canine, feline, rodent or murine species can be treated. However, the method can also be practiced in other species, such as avian species (e.g., chickens).

Diseases and conditions associated with inflammation and infection can be treated using the method of the present invention. In a preferred embodiment, the disease or condition is one in which the actions of eosinophils and/or lymphocytes are to be inhibited or promoted, in order to modulate the inflammatory response.

Diseases or conditions of humans or other species which can be treated with inhibitors of chemokine receptor function, include, but are not limited to: inflammatory or allergic diseases and conditions, including respiratory allergic diseases such as asthma, allergic rhinitis, hypersensitivity lung diseases, hypersensitivity pneumonitis, eosinophilic pneumonias (e.g., Loeffler's syndrome, chronic eosinophilic pneumonia), delayed-type hypersentitivity, interstitial lung diseases (ILD) (e.g., idiopathic pulmonary fibrosis, or ILD associated with rheumatoid arthritis, systemic lupus erythematosus, ankylosing spondylitis, systemic sclerosis, Sjogren's syndrome, polymyositis or dermatomyositis); systemic anaphylaxis or hypersensitivity responses, drug allergies (e.g., to penicillin, cephalosporins), insect sting allergies; autoimmune diseases, such as rheumatoid arthritis, psoriatic arthritis, multiple sclerosis, systemic lupus erythematosus, myasthenia gravis, juvenile onset diabetes; glomerulonephritis, autoimmune thyroiditis, Behcet's disease; graft rejection (e.g., in transplantation), including allograft rejection or graft-versus-host disease; inflammatory bowel

diseases, such as Crohn's disease and ulcerative colitis; spondyloarthropathies; scleroderma; psoriasis (including T-cell mediated psoriasis) and inflammatory dermatoses such an dermatitis, eczema, atopic dermatitis, allergic contact dermatitis, urticaria; vasculitis (e.g., necrotizing, cutaneous, and hypersensitivity vasculitis); eosinphilic myositis, eosinophilic fasciitis; cancers with leukocyte infiltration of the skin or organs. Other diseases or conditions in which undesirable inflammatory responses are to be inhibited can be treated, including, but not limited to, reperfusion injury, atherosclerosis, certain hematologic malignancies, cytokine-induced toxicity (e.g., septic shock, endotoxic shock), polymyositis, dermatomyositis.

Diseases or conditions of humans or other species which can be treated with promoters of chemokine receptor function, include, but are not limited to: immunosuppression, such as that in individuals with immunodeficiency syndromes such as AIDS, individuals undergoing radiation therapy, chemotherapy, therapy for autoimmune disease or other drug therapy (e.g., corticosteroid therapy), which causes immunosuppression; immunosuppression due congenital deficiency in receptor function or other causes; and infectious diseases, such as parasitic diseases, including, but not limited to helminth infections, such as nematodes (round worms); (Trichuriasis, Enterobiasis, Ascariasis, Hookworm, Strongyloidiasis, Trichinosis, filariasis); trematodes (flukes) (Schistosomiasis, Clonorchiasis), cestodes (tape worms) (Echinococcosis, Taeniasis saginata, Cysticercosis); visceral worms, visceral larva migrans (e.g., Toxocara), eosinophilic gastroenteritis (e.g., Anisaki spp., *Phocanema ssp.),* cutaneous larva migrans (*Ancylostona braziliense, Ancylostoma caninum*).

The compounds of the present invention are accordingly useful in the prevention and treatment of a wide variety of inflammatory and immunoregulatory disorders and diseases.

In another aspect, the instant invention may be used to evaluate putative specific agonists or antagonists of chemokine receptors, including CCR-1, CCR-2, CCR-2A, CCR-2B, CCR-3, CCR-4, CCR-5, CXCR-3, and CXCR-4. Accordingly, the present invention is

directed to the use of these compounds in the preparation and execution of screening assays for compounds which modulate the activity of chemokine receptors. For example, the compounds of this invention are useful for isolating receptor mutants, which are excellent screening tools for more potent compounds. Furthermore, the compounds of this invention are useful in establishing or determining the binding site of other compounds to chemokine receptors, e.g., by competitive inhibition. The compounds of the instant invention are also useful for the evaluation of putative specific modulators of the chemokine receptors, including CCR-1, CCR-2, CCR-2A, CCR-2B, CCR-3, CCR-4, CCR-5, CXCR-3, and CXCR-4. As appreciated in the art, thorough evaluation of specific agonists and antagonists of the above chemokine receptors has been hampered by the lack of availability of non-peptidyl (metabolically resistant) compounds with high binding affinity for these receptors. Thus the compounds of this invention are commercial products to be sold for these purposes.

The present invention is further directed to a method for the manufacture of a medicament for modulating chemokine receptor activity in humans and animals comprising combining a compound of the present invention with a pharmaceutical carrier or diluent.

The present invention is further directed to the use of these compounds in the prevention or treatment of infection by a retrovirus, in particular, the human immunodeficiency virus (HIV) and the treatment of, and delaying of the onset of consequent pathological conditions such as AIDS. Treating AIDS or preventing or treating infection by HIV is defined as including, but not limited to, treating a wide range of states of HIV infection: AIDS, ARC (AIDS related complex), both symptomatic and asymptomatic, and actual or potential exposure to HIV. For example, the compounds of this invention are useful in treating infection by HIV after suspected past exposure to HIV by, e.g., blood transfusion, organ transplant, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery. In addition, a compound of the present invention may be used for the prevention of infection by HIV and the prevention of AIDS, such

as in post-coital prophylaxis or in the prevention of maternal transmission of the HIV virus to a fetus or a child upon birth.

In a preferred aspect of the present invention, a subject compound may be used in a method of inhibiting the binding of a human immunodeficiency virus to a chemokine receptor, such as CCR-5 and/or CXCR-4, of a target cell, which comprises contacting the target cell with an amount of the compound which is effective at inhibiting the binding of the virus to the chemokine receptor.

The subject treated in the methods above is a mammal, preferably a human being, male or female, in whom modulation of chemokine receptor activity is desired. "Modulation" as used herein is intended to encompass antagonism, agonism, partial antagonism and/or partial agonism. The term "therapeutically effective amount" means the amount of the subject compound that will elicit the biological or medical response of a tissue, system, animal or human that is being sought by the researcher, veterinarian, medical doctor or other clinician.

The term "composition" as used herein is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts. By "pharmaceutically acceptable" it is meant the carrier, diluent or excipient must be compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

The terms "administration of" and or "administering a" compound should be understood to mean providing a compound of the invention or a prodrug of a compound of the invention to the individual in need of treatment.

Combined therapy to modulate chemokine receptor activity and thereby prevent and treat inflammatory and immunoregulatory disorders and diseases, including asthma and allergic diseases, as well as autoimmune pathologies such as rheumatoid arthritis and atherosclerosis, and those pathologies noted above is illustrated by the combination of the compounds of this invention and other compounds which are known for such utilities.

For example, in the treatment or prevention of inflammation, the present compounds may be used in conjunction with an antiinflammatory or analgesic agent such as an opiate agonist, a lipoxygenase inhibitor, such as an inhibitor of 5-lipoxygenase, a cyclooxygenase inhibitor, such as a cyclooxygenase-2 inhibitor, an interleukin inhibitor, such as an interleukin-1 inhibitor, an NMDA antagonist, an inhibitor of nitric oxide or an inhibitor of the synthesis of nitric oxide, a non-steroidal antiinflammatory agent, or a cytokine-suppressing antiinflammatory agent, for example with a compound such as acetaminophen, asprin, codiene, fentanyl, ibuprofen, indomethacin, ketorolac, morphine, naproxen, phenacetin, piroxicam, a steroidal analgesic, sufentanyl, sunlindac, tenidap, and the like. Similarly, the instant compounds may be administered with a pain reliever; a potentiator such as caffeine, an H2-antagonist, simethicone, aluminum or magnesium hydroxide; a decongestant such as phenylephrine, phenylpropanolamine, pseudophedrine, oxymetazoline, ephinephrine, naphazoline, xylometazoline, propylhexedrine, or levo-desoxy-ephedrine; an antiitussive such as codeine, hydrocodone, caramiphen, carbetapentane, or dextramethorphan; a diuretic; and a sedating or non-sedating antihistamine. Likewise, compounds of the present invention may be used in combination with other drugs that are used in the treatment/prevention/suppression or amelioration of the diseases or conditions for which compounds of the pressent invention are useful. Such other drugs may be administered, by a route and in an amount commonly used therefor, contemporaneously or sequentially with a compound of the present invention. When a compound of the present invention is used contemporaneously with one or more other drugs, a pharmaceutical composition containing such other drugs in addition to the compound of the present invention is preferred. Accordingly, the pharmaceutical compositions of the present invention include those that also contain one or more other active ingredients, in addition to a compound of the present invention. Examples of other active ingredients that may be combined with a compound of the present invention, either administered separately or in the same pharmaceutical compositions, include, but are not limited to: (a) VLA-4

antagonists such as those described in US 5,510,332, WO97/03094, WO97/02289, WO96/40781, WO96/22966, WO96/20216, WO96/01644, WO96/06108, WO95/15973 and WO96/31206; (b) steroids such as beclomethasone, methylprednisolone, betamethasone, prednisone, dexamethasone, and hydrocortisone; (c) immunosuppressants such as cyclosporin, tacrolimus, rapamycin and other FK-506 type immunosuppressants; (d) antihistamines (H1-histamine antagonists) such as bromopheniramine, chlorpheniramine, dexchlorpheniramine, triprolidine, clemastine, diphenhydramine, diphenylpyraline, tripelennamine, hydroxyzine, methdilazine, promethazine, trimeprazine, azatadine, cyproheptadine, antazoline, pheniramine pyrilamine, astemizole, terfenadine, loratadine, cetirizine, fexofenadine, descarboethoxyloratadine, and the like; (e) non-steroidal anti-asthmatics such as β2-agonists (terbutaline, metaproterenol, fenoterol, isoetharine, albuterol, bitolterol, and pirbuterol), theophylline, cromolyn sodium, atropine, ipratropium bromide, leukotriene antagonists (zafirlukast, montelukast, pranlukast, iralukast, pobilukast, SKB-106,203), leukotriene biosynthesis inhibitors (zileuton, BAY-1005); (f) non-steroidal antiinflammatory agents (NSAIDs) such as propionic acid derivatives (alminoprofen, benoxaprofen, bucloxic acid, carprofen, fenbufen, fenoprofen, fluprofen, flurbiprofen, ibuprofen, indoprofen, ketoprofen, miroprofen, naproxen, oxaprozin, pirprofen, pranoprofen, suprofen, tiaprofenic acid, and tioxaprofen), acetic acid derivatives (indomethacin, acemetacin, alclofenac, clidanac, diclofenac, fenclofenac, fenclozic acid, fentiazac, furofenac, ibufenac, isoxepac, oxpinac, sulindac, tiopinac, tolmetin, zidometacin, and zomepirac), fenamic acid derivatives (flufenamic acid, meclofenamic acid, mefenamic acid, niflumic acid and tolfenamic acid), biphenylcarboxylic acid derivatives (diflunisal and flufenisal), oxicams (isoxicam, piroxicam, sudoxicam and tenoxican), salicylates (acetyl salicylic acid, sulfasalazine) and the pyrazolones (apazone, bezpiperylon, feprazone, mofebutazone, oxyphenbutazone, phenylbutazone); (g) cyclooxygenase-2 (COX-2) inhibitors; (h) inhibitors of phosphodiesterase type IV (PDE-IV); (i) other antagonists of the chemokine receptors, especially CCR-1, CCR-2, CCR-3 and CCR-5; (j) cholesterol lowering agents such as HMG-CoA

The weight ratio of the compound of the compound of the present invention to the second active ingredient may be varied and will depend upon the effective dose of each ingredient. Generally, an effective dose of each will be used. Thus, for example, when a compound of the present invention is combined with an NSAID the weight ratio of the compound of the present invention to the NSAID will generally range from about 1000:1 to about 1:1000, preferably about 200:1 to about 1:200. Combinations of a compound of the present invention and other active ingredients will generally also be within the aforementioned range, but in each case, an effective dose of each active ingredient should be used.

The present invention is further directed to combinations of the present compounds with one or more agents useful in the prevention or treatment of AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of the AIDS antivirals, immunomodulators, anti-infectives, or vaccines known to those of ordinary skill in the art.

It will be understood that the scope of combinations of the compounds of this invention with AIDS antivirals, immunomodulators, anti-infectives or vaccines is not limited to the list in the above Table, but includes in principle any combination with any pharmaceutical composition useful for the treatment of AIDS.

Preferred combinations are simultaneous or alternating treatments of with a compound of the present invention and an inhibitor of HIV protease and/or a non-nucleoside inhibitor of HIV reverse transcriptase. An optional fourth component in the combination is a nucleoside inhibitor of HIV reverse transcriptase, such as AZT, 3TC, ddC or ddI. A preferred inhibitor of HIV protease is indinavir, which is the sulfate salt of N-(2(R)-hydroxy-1(S)-indanyl)-2(R)-phenylmethyl-4-(S)-hydroxy-5-(1-(4-(3-pyridyl-methyl)-2(S)-N'-(t-butylcarboxamido)-piperazinyl))-pentaneamide ethanolate, and is synthesized according to U.S. 5,413,999. Indinavir is generally administered at a dosage of 800 mg three times a day. Other preferred protease inhibitors are nelfinavir and ritonavir. Another preferred inhibitor of HIV protease is saquinavir which is administered in a dosage of 600 or 1200 mg tid. Preferred non-nucleoside inhibitors of HIV reverse transcriptase include efavirenz. The preparation of ddC, ddI and AZT are also described in EPO 0,484,071. These combinations may have unexpected effects on limiting the spread and degree of infection of HIV. Preferred combinations include those with the following (1) indinavir with efavirenz, and, optionally, AZT and/or 3TC and/or ddI and/or ddC; (2) indinavir, and any of AZT and/or ddI and/or ddC and/or 3TC, in particular, indinavir and AZT and 3TC; (3) stavudine and 3TC and/or zidovudine; (4) zidovudine and lamivudine and 141W94 and 1592U89; (5) zidovudine and lamivudine.

In such combinations the compound of the present invention and other active agents may be administered separately or in conjunction. In addition, the administration of one element may be prior to, concurrent to, or subsequent to the administration of other agent(s).

The compounds of the present invention may be administered by oral, parenteral (e.g., intramuscular, intraperitoneal, intravenous, ICV, intracisternal injection or infusion, subcutaneous injection, or implant), by inhalation spray, nasal, vaginal, rectal, sublingual, or topical routes of administration and may be formulated, alone or together, in suitable dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants

and vehicles appropriate for each route of administration. In addition to the treatment of warm-blooded animals such as mice, rats, horses, cattle, sheep, dogs, cats, monkeys, etc., the compounds of the invention are effective for use in humans.

The pharmaceutical compositions for the administration of the compounds of this invention may conveniently be presented in dosage unit form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the pharmaceutical compositions are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation. In the pharmaceutical composition the active object compound is included in an amount sufficient to produce the desired effect upon the process or condition of diseases. As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn

starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the techniques described in the U.S. Patents 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinyl- pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally- occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile

injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

The compounds of the present invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, jellies, solutions or suspensions, etc., containing the compounds of The present invention are employed. (For purposes of this application, topical application shall include mouth washes and gargles.)

The pharmaceutical composition and method of the present invention may further comprise other therapeutically active compounds as noted herein which are usually applied in the treatment of the above mentioned pathological conditions.

In the treatment or prevention of conditions which require chemokine receptor modulation an appropriate dosage level will generally be about 0.001 to 100 mg per kg patient body weight per day which can be administered in single or multiple doses. Preferably, the dosage level will be about 0.01 to about 25 mg/kg per day; more preferably about 0.05 to about 10 mg/kg per day. A suitable dosage level may be about 0.01 to 25 mg/kg per day, about 0.05 to 10 mg/kg per day, or about 0.1 to 5 mg/kg per day. Within this range the dosage may be 0.005 to 0.05, 0.05 to 0.5 or 0.5 to 5.0 mg/kg per day. For oral administration, the compositions are preferably provided in the form of tablets containing 1.0 to 1000 milligrams of the active ingredient, particularly 1.0, 5.0, 10.0, 15.0. 20.0, 25.0, 50.0, 75.0, 100.0, 150.0, 200.0, 250.0, 300.0, 400.0, 500.0,

600.0, 750.0, 800.0, 900.0, and 1000.0 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The compounds may be administered on a regimen of 1 to 4 times per day, preferably once or twice per day.

It will be understood, however, that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

Several methods for preparing the compounds of this invention are illustrated in the following Schemes and Examples.

The compounds of the present invention are prepared by alkylating azacycle **1**, in which R_1 = H, under appropriate conditions (**Scheme 1**). The required azacycle starting materials are prepared using methods described in the literature; such as described in Ong, H. H. *et al*, Journal of Medicinal Chemistry, 1983,26, 981-986, and Nargund, R. *et al*, USSN 08/147,226 (November 3, 1993), EP 93309867.5.

Thus, azacycle **1** (R_1=H) is combined with the appropriate aldehyde and the intermediate imine is reduced to the tertiary amine chemically (e.g. using sodium cyanoborohydride) or catalytically (e.g. using hydrogen and palladium on carbon or Raney nickel catalyst) (**Scheme 1**). The aldehyde needed for this reaction can be prepared by methods generally known in the chemical literature; for the purposes of the present invention the preparation of a representative aldehyde is described in Hale, J.J.; Finke, P.E.; MacCoss, M. *Bioorganic & Medicinal Chemistry Letters* **1993**,*3*, 319-322.

In an alternative embodiment of the present invention, azacycle **1** (R_1=H) can be alkylated with an alkyl halide or alkyl sulfonate ester (with or without an added base to neutralize the mineral acid or sulfonic acid by-product) to give the desired compound (**Scheme 1**). The alkyl halide or alkyl sulfonate needed for this reaction can be prepared by methods generally known in the chemical literature; for the purposes of the present invention an aldehyde, prepared as

described above, can be reduced to an alcohol with sodium borohydride, diisobutylaluminum hydride or lithium aluminum hydride, and the product alcohol converted to either the alkyl halide using methods described in March J. "Advanced Organic Chemistry", 3rd ed., John Wiley & Sons, New York, pp. 382-384 (1985), or alkyl sulfonate ester using methods described in March J. "Advanced Organic Chemistry", 3rd ed., John Wiley & Sons, New York, p. 444 (1985).

In an alternative embodiment of the present invention, **1** (R_1 = H) can be acylated to give the tertiary amide and subsequent reduction with a strong reducing agent (e.g. diborane including borane dimethylsulfide; and, lithium aluminum hydride) will give the desired compound (Scheme 1). The acylating agent needed for this reaction can be prepared by methods generally known in the chemical literature; for the purposes of the present invention an aldehyde, prepared as described above, can be oxidized using such commonly used reagents as permanganate in acid or silver oxide, and the resulting acid activated as an acid chloride or mixed anhydride which can be used to acylate **I** (R_1 = H). The product amide can be reduced with a strong reducing agent, such as diborane or lithium aluminum hydride, to give the tertiary amine.

Optionally, compound **1** formed in the alkylation step may be further modified in subsequent reactions. In one illustration of such an approach,the aldehyde fragment contained a t-butoxycarbonylamino group (Example 2). After reductive amination, the t-butoxycarbonyl protecting group is removed by treatment with a strong acid such as trifluoroacetic acid or formic acid and the resulting amine is acylated to furnish the desired compounds (Example 3). Alternatively, the protecting group may also be present in the azacycle portion as illustrated with a benzyloxycarbonyl group in Example 6. Thus an azacycle containing a benzyloxycarbonylindoline (prepared in Example 4) is alkylated with an aldehyde in the presence of a reducing agent. Next, the protecting group is removed to liberate a free amine (Example 7) and the amine is further reacted to provide additional analogs (Example 8).

In an alternative embodiment of the present invention, the allyl acid **2** (described in Hale *et al*; see above) can be converted into the N-methyl methoxy amide **3**, which is then treated with an alkyl or aryl metal reagent, for example methyllithium or butyllithium, to provide the ketone **4** (Scheme 2). The ketone can be converted into an imine which can then be reduced to secondary amine **5** chemically, (e.g using sodium cyanoborohydride or sodium borohydride), or catalytically (e.g. using hydrogen and palladium on carbon or Raney nickel catalyst). Acylation under standard conditions, for example with an acid chloride, provides amide **6**. The allyl group in **6** can be oxidatively cleaved to aldehyde **7** with osmium tetroxide followed by sodium periodate or with ozone at low temperature. Reductive amination of aldehyde **7** with azacycle **1** can then be carried out under the conditions described above.

Substituted spiro(indoline-3,4'-piperidine) derivatives can be prepared as shown in Scheme 3 starting from the appropriately substituted phenylhydrazines. Following the Fischer indole reaction and reduction of the intermediate imine with a mild reducing agent such as sodium borohydride, the indoline nitrogen can be reacted with an electrophile such as an acyl chloride or a sulfonyl chloride. The protecting group on the piperidine nitrogen, for example a benzyloxycarbonyl group, can be removed by treatment with hydrogen in the presence of palladium on carbon or by exposure to trimethylsilyl iodide, to give the deprotected substituted spiro(indoline-3,4'-piperidine).

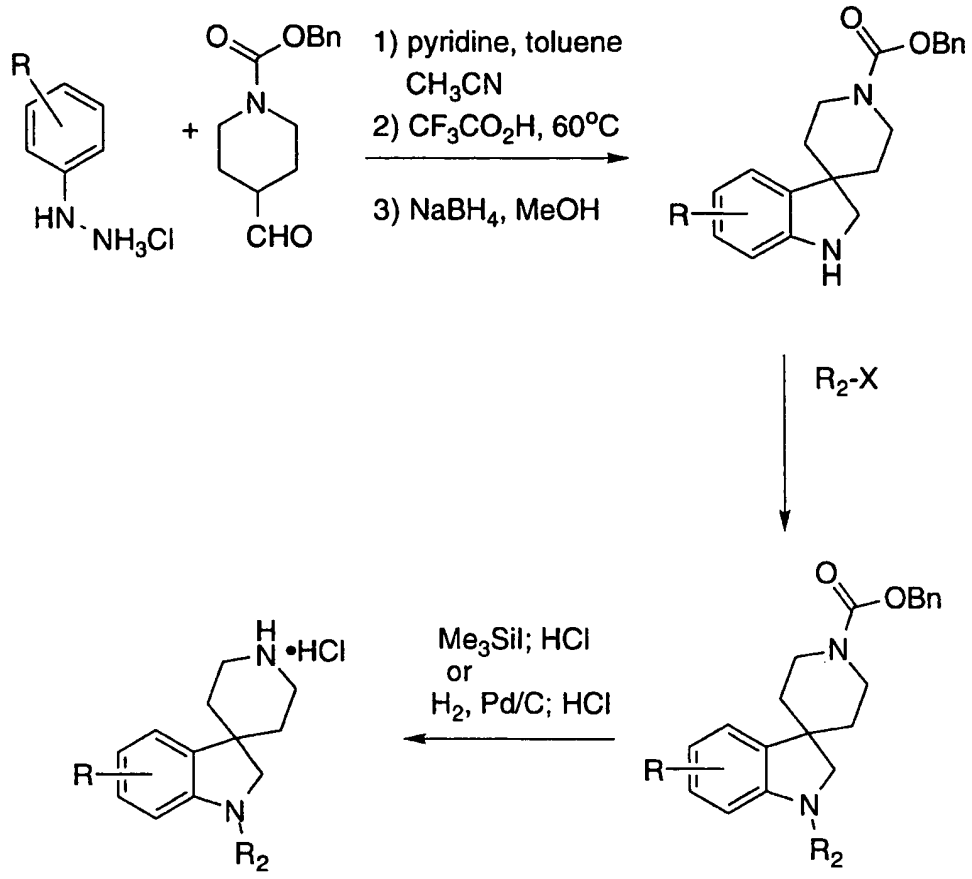
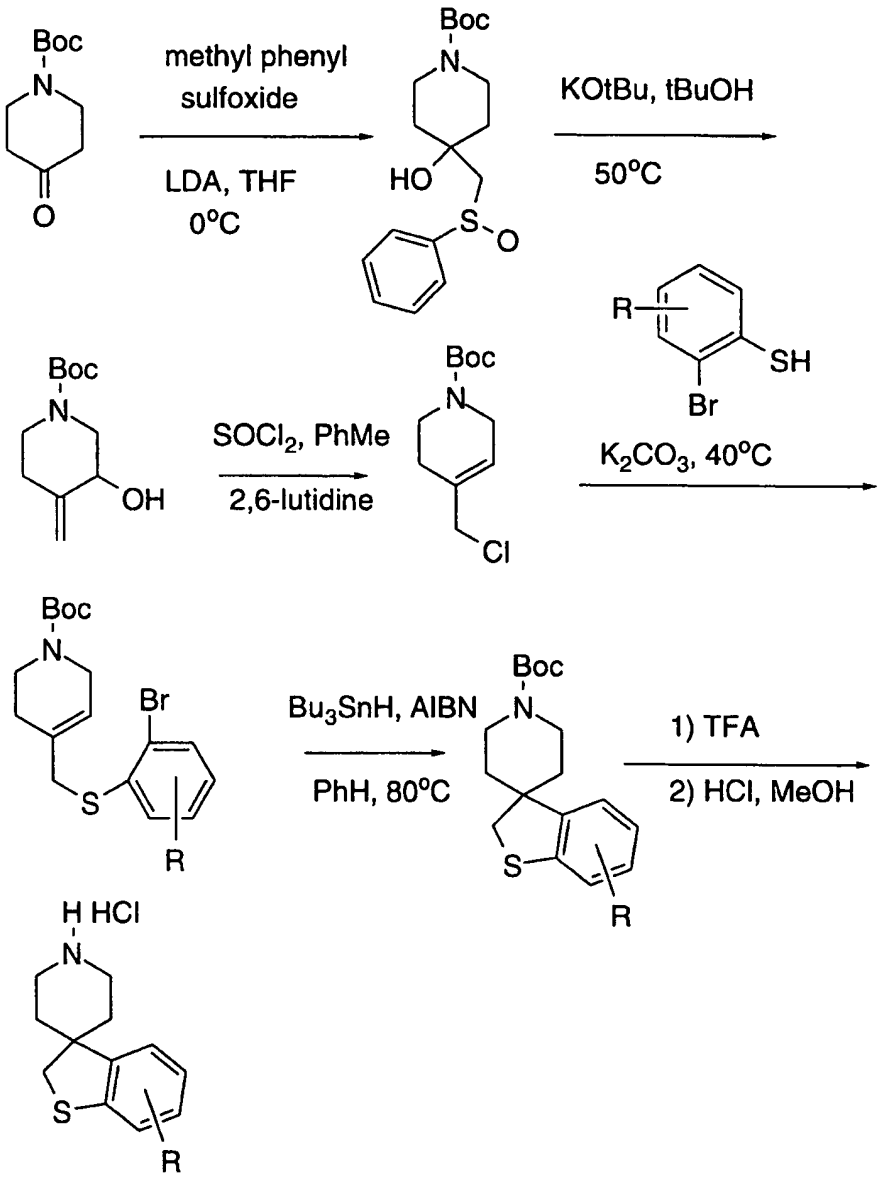
SCHEME 3



Preparation of spiro(2,3-dihydrobenzothiophene-3,4'-piperidine) derivatives is shown in Scheme 4. Reaction of N-Boc protected 4-piperidone with the lithium salt of methyl phenyl sulfoxide followed by base-mediated elimination-rearrangement and basic cleavage provides the indicated allylic alcohol. The alcohol can be converted to the rearranged allylic chloride with thionyl chloride in toluene in the presence of 2,6-lutidine as a proton scavenger. Displacement of the chloride with functionalized 2-bromothiophenol provides the allylic sulfide, which can be cyclized under radical conditions to give the illustrated spiro(2,3-dihydrobenzothiophene-3,4'-piperidine). Cleavage of the t-butoxycarbonyl group under standard

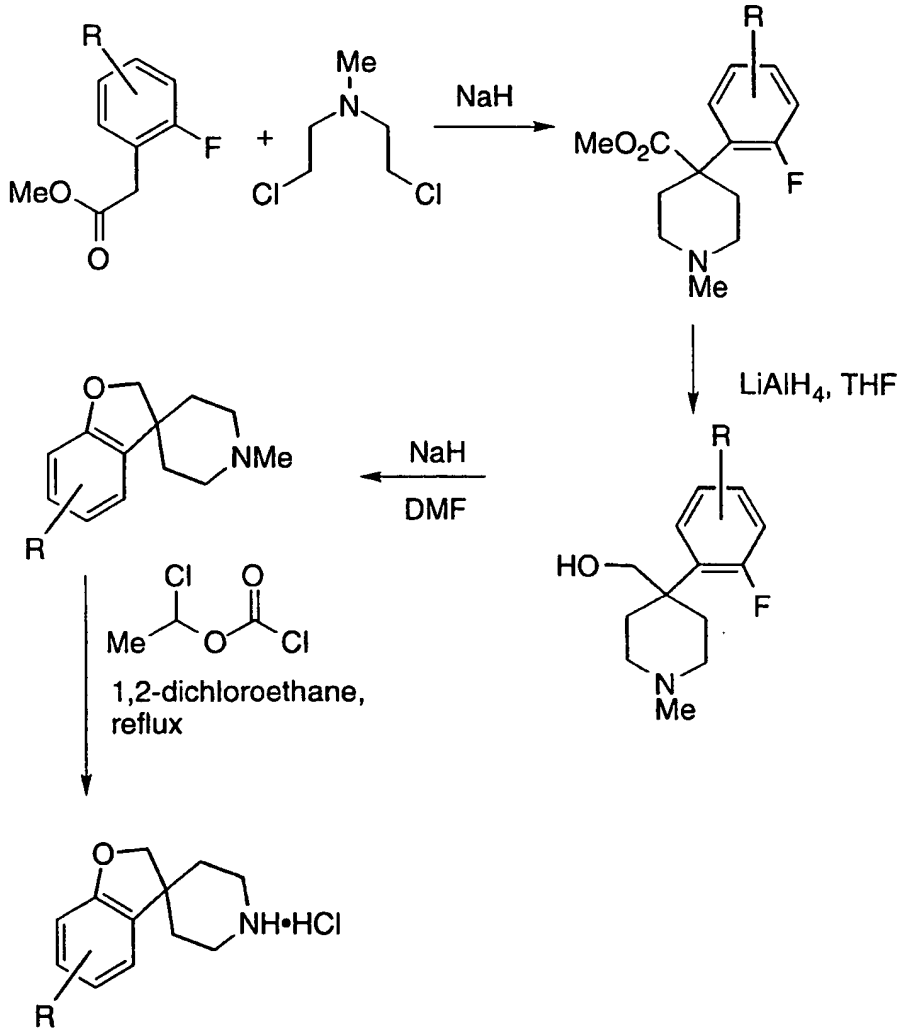
conditions, such as trifluoroacetic acid, then provides the desired spirocycle.

SCHEME 4



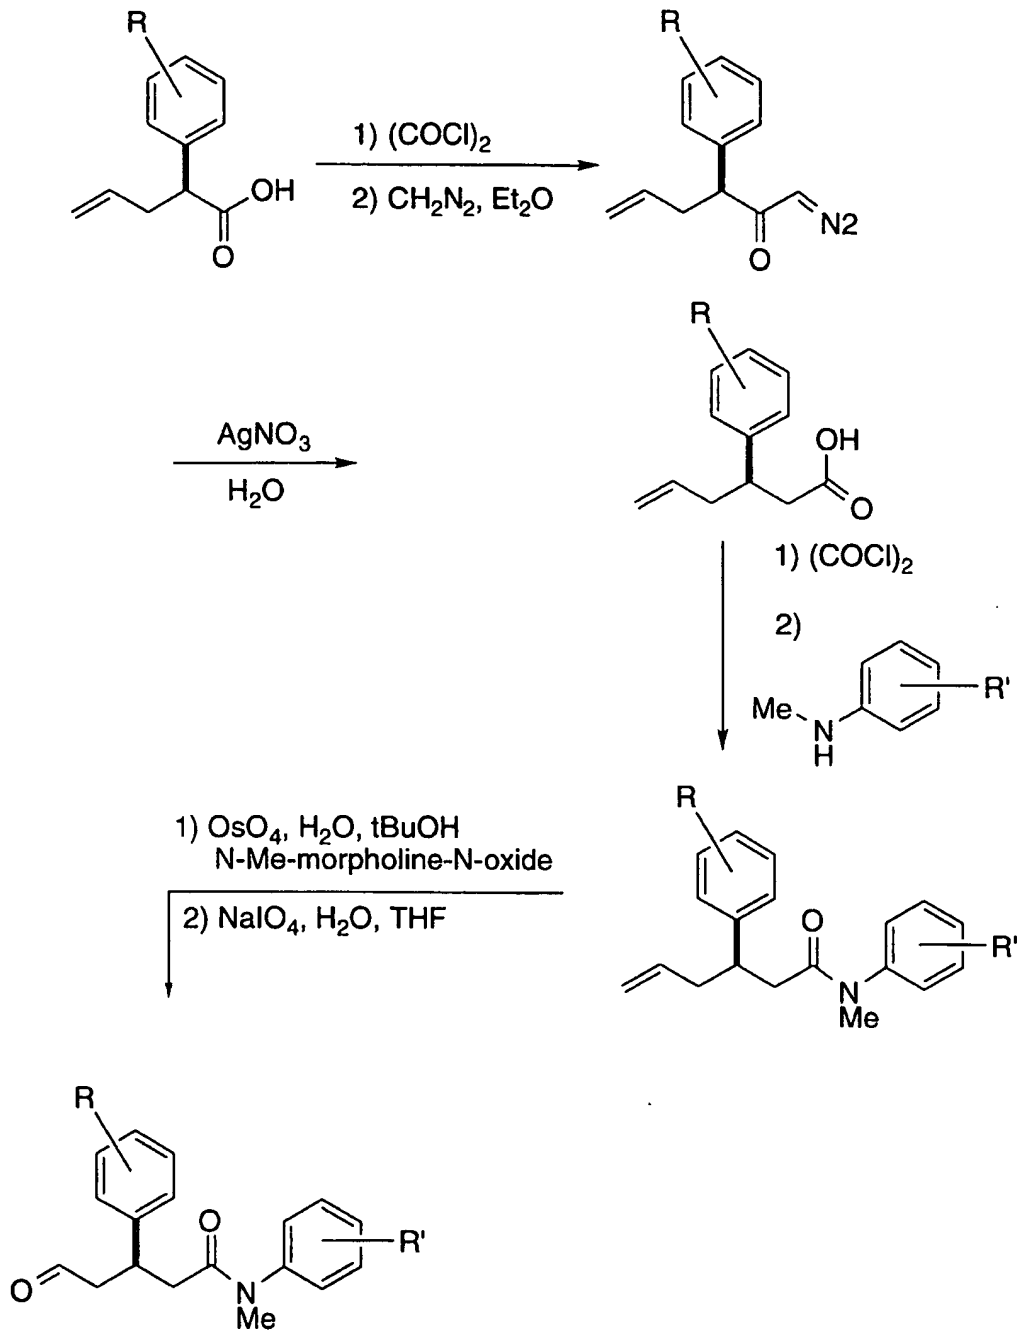
Spiro(2,3-dihydrobenzofuran-3,4'-piperidine) derivatives can be prepared as illustrated in Scheme 5. Treatment of an appropiately substituted ester of 2-fluorophenylacetate with mechlorethamine hydrochloride under basic conditions provides the piperidine product, which on treatment with a strong reducing agent such as lithium aluminum hydride produces the corresponding 4-(hydroxymethyl) compound. Cyclization with base provides the benzofuran derivative, and cleavage of the N-methyl group can then be carried out using 1-chloroethyl chloroformate or other suitable N-demethylating agents.

SCHEME 5



Compounds with alternate arrangements of the amide bond can be prepared as shown in Scheme 6. The illustrated acid can be homologated under Arndt-Eistert conditions to give the chain-extended acid, which can be derivatized under standard acylating conditions with, for example, an aniline derivative, to give the corresponding amide. Oxidative cleavage of the olefin with osmium tetroxide or ozone then provides the aldehyde intermediate suitable for coupling as described earlier.

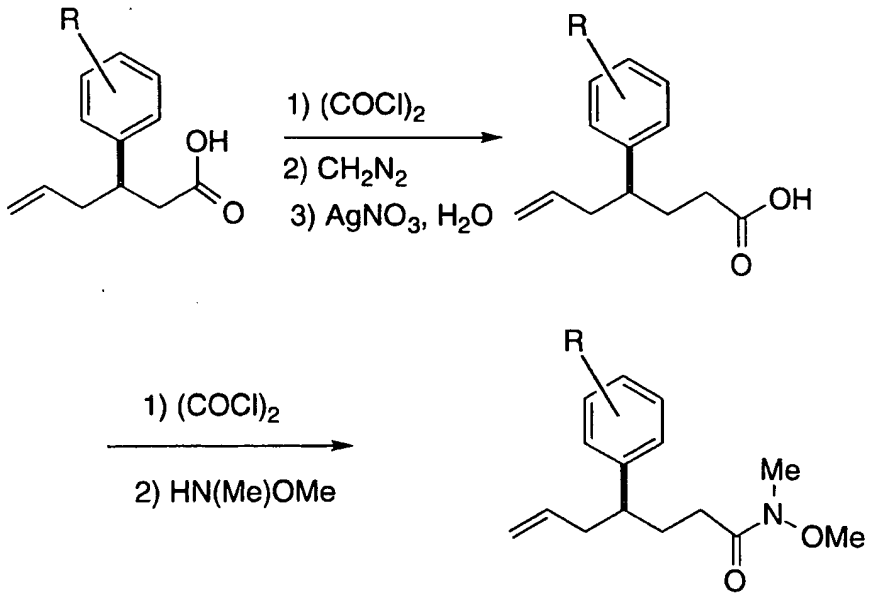
SCHEME 6

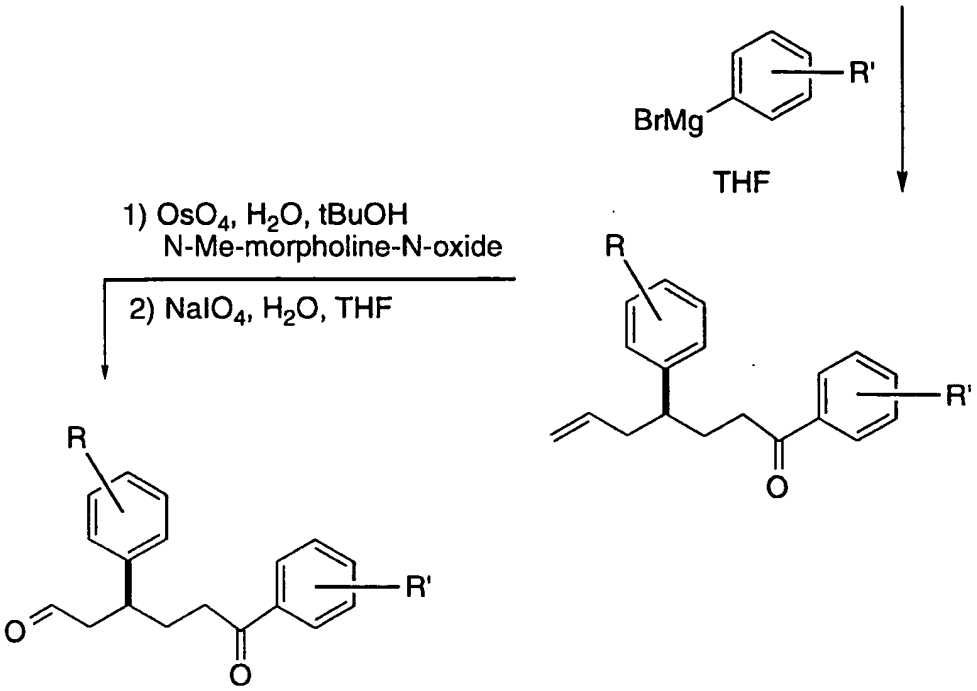


In addition, ketone derivatives can be prepared by an extension of the chemistry given above, as shown in Scheme 7. A second

Arndt-Eistert chain extension provides the illustrated heptenoic acid derivative, which after conversion into its N-methoxy-N-methyl amide, can be reacted with an aryl organometallic reagent, such as an aryl magnesium bromide, to provide the ketone. Routine oxidative cleavage then gives the desired aldehyde, which can be coupled with a spiro-piperidine derivative as described above.

SCHEME 7





Alcohol containing antagonists can be prepared according to procedures given in Scheme 8. Formation of the N-methyl-N-methoxy amide of the indicated acid followed by oxidative cleavage of the olefin provides the intermediate aldehyde. Coupling with a spiro(indoline-3,4'-piperidine) derivative followed by addition of an organometallic reagent to the amide provides the illustrated ketone. Treatment with a hydride reducing agent, such as sodium borohydride, then yields the desired alcohol derivatives.

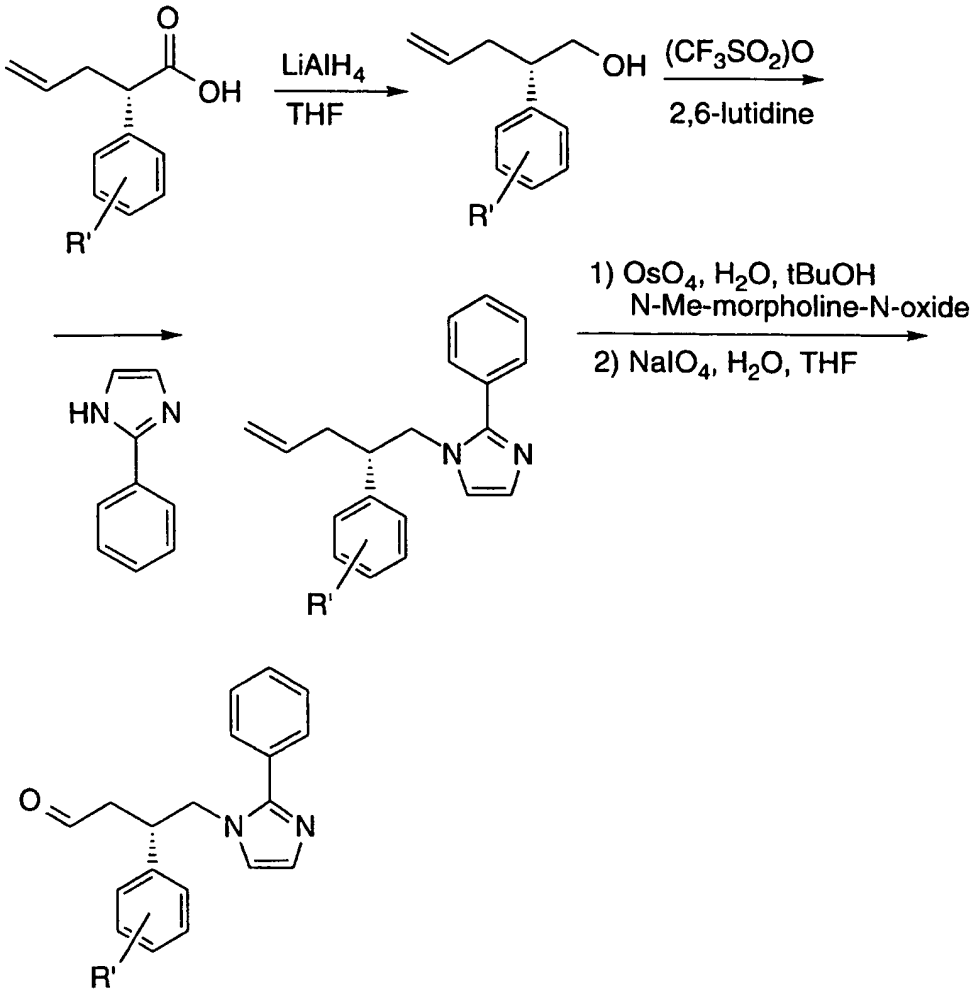
Formation of heterocycle substituted antagonists can be carried out according to the procedure given in Scheme 9 for substituted imidazoles. Reduction of the allyl acid with a strong reducing agent such as lithium aluminum hydride followed by in situ formation of the trifluoromethanesulfonate of the formed alcohol allows for displacement of the triflate with a nucleophile such as 2-phenylimidazole. Oxidative cleavage under standard conditions provides the indicated aldehyde which can then be coupled under the conditions described above to the appropriate spiro derivative.

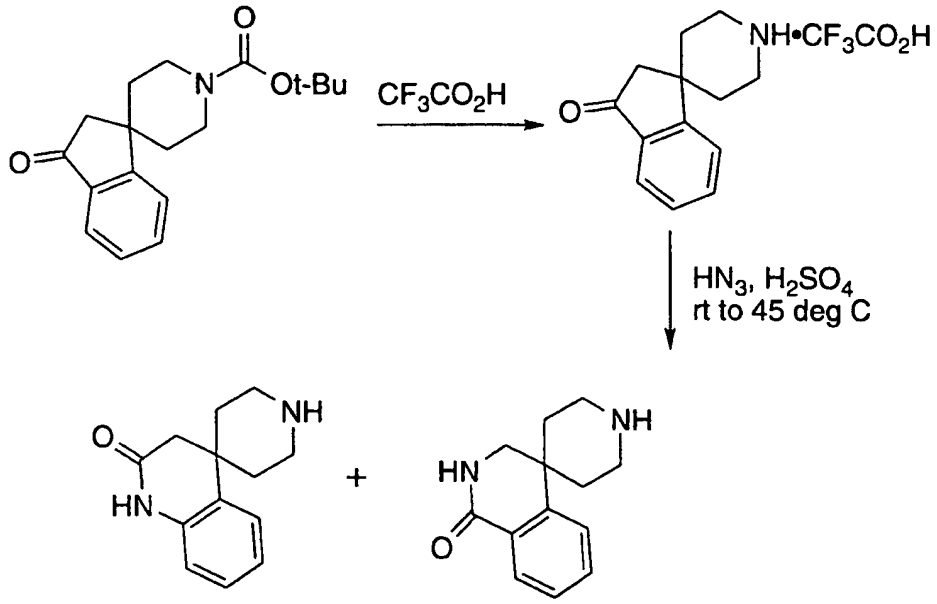
SCHEME 9



Spiro(2-oxo-1,2,3,4-tetrahydroquinoline-4,4'-piperidine) and spiro(1-oxo-1,2,3,4-tetrahydroisoquinoline-4,4'-piperidine) can be prepared as shown in Scheme 10. Starting from the indicated spiro(2-oxoindane-3,4'-piperidine) (described in Claremon, D.A. *et al*, European Patent 0 431 943 943 A2, Evans, B.E. *et al*, U.S. Patent 5,091,387, Davis, L. *et al*, U.S. Patent 4,420,485, all of which are incorporated by reference, and Parham *et al*, Journal of Organic Chemistry, 41, 2628 (1976)), deprotection of the piperidine nitrogen is carried out by treatment with acid, for example trifluoroacetic acid, followed by protection as the trifluoroacetamide, and the product is exposed to hydrazoic acid in the

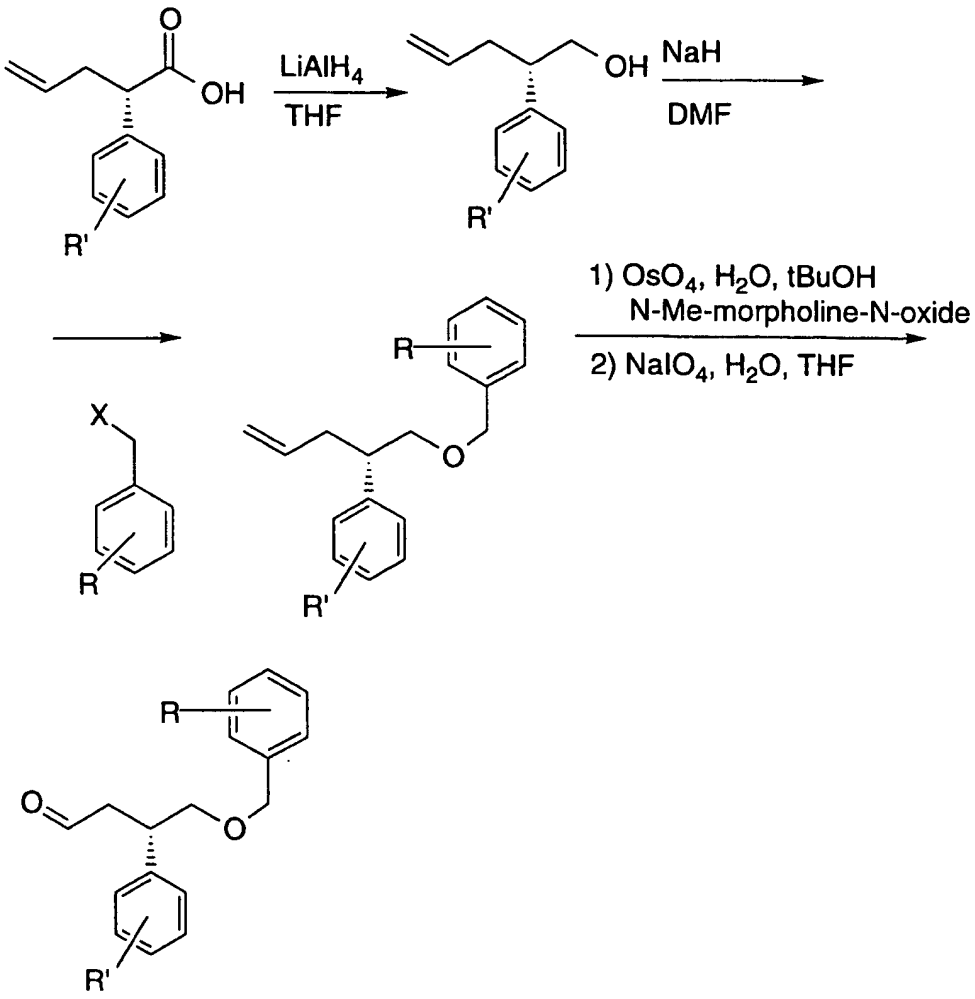
presence of sulfuric acid. Heating of this mixture effects a Schmidt rearrangement, to provide both the tetrahydroquinoline and the tetrahydroisoquinoline derivatives. These spiro compounds can then be separated and coupled to functionalized aldehydes by the methodology given above.

SCHEME 10



Compounds with ether substituents can also be prepared by the route shown in Scheme 11. Thus, the allyl acid discussed earlier can be reduced to the corresponding alcohol with, for example, lithium aluminum hydride. This alcohol can be alkylated by a Williamson ether synthesis, by deprotonation with a strong base such as sodium hydride or sodium hexamethyldisilazide followed by reaction with a benzyl halide such as benzyl bromide. The product can be processed through the oxidative cleavage steps described earlier to provide the aldehyde, which can then be coupled with a spirocycle kunder reductive amination conditions or else by reduction to the corresponding alcohol and conversion to the bromide. the bromide can then be used to alkylate a spirocycle under the conditions detailed above.

SCHEME 11



In some cases the order of carrying out the foregoing reaction schemes may be varied to facilitate the reaction or to avoid unwanted reaction products.

The following examples are provided for the purpose of further illustration only and are not intended to be limitations on the disclosed invention.

EXAMPLE 1

3-(S)-(3,4-Dichlorophenyl)-4-(N-(t-butoxycarbonyl)methylamino) butanal

A solution of 10 g (41 mmol) of 3-(S)-(3,4-dichloro-phenyl)-4-methylamino-1-pentene in 100 mL of CH_2Cl_2 was cooled in an ice bath and treated with 5.8 mL (41 mmol) of triethylamine (Et_3N) and 9 g (41 mmol) of di-t-butyl dicarbonate. The cold bath was removed after 5 min and the stirring was continued for 1 h. The reaction mixture was diluted with CH_2Cl_2 and washed with water, 1.2 N HCl, saturated $NaHCO_3$ and brine. The solution was dried over Na_2SO_4 and concentrated to give 14.58 g of residual oil. ^1H NMR ($CDCl_3$, ppm ranges are given because of amide rotomers and line broadening) δ 1.36 (s, 9H), 2.33 (m, 2H), 2.60 & 2.70 (2s, 3H), 2.8-3.6 (m, 3H), 4.94 (m, 2H), 5.59 (m, 1H), 6.9-7.4 (m, 3H).

The residue was dissolved in 80 mL of acetone, 40 mL of t-butanol and 40 mL of water. To this solution 1 mL of osmium tetroxide (4% solution in water) and 5.15 g (44 mmol) of 4-methylmorpholine N-oxide were added. After stirring for 26 h, the reaction was quenched with approximately 5 g of Na_2SO_3 and concentrated to 25% of the original volume. The residue was partitioned between water and 1:1 ether (Et_2O), ethyl acetate (EtOAc), the layers were separated and the aqueous layer was extracted with Et_2O:EtOAc. Each organic layer was washed with water, brine and dried by filtering through Na_2SO4. The filtrate was concentrated to afford the crude diol.

A solution of the diol in 120 mL of tetrahydrofuran (THF) and 40 mL of water was treated with 9.42 g (44 mmol) of sodium periodate. After stirring for 2 h, the reaction was diluted with Et_2O:EtOAc and washed with water and brine. The organic layer was dried (Na_2SO_4) and the filtrate was concentrated. The residue was purified by prepLC using 30% EtOAc/hexane to furnish 11.74 g (83% yield for three steps) of the title compound as a thick oil.

^1H NMR (CDCl3, ppm ranges are given because of amide rotomers and line broadening) δ 1.38 (s, 9H), 2.69 & 2.75 (2s, 3H), 2.6-3.65 (m, 5H), 6.95-7.4 (m, 3H), 9.67 (s, 1H).

EXAMPLE 2

1'-(3-(S)-(3,4-Dichlorophenyl)-4-(N-(t-butoxycarbonyl)(methyl-amino))butyl)-1-methanesulfonyl-spiro(indoline-3,4'-piperidine)

To a solution of 0.76 g (2.2 mmol) of 3-(S)-(3,4-dichlorophenyl)-4-(N-(t-butoxycarbonyl)methylamino)butanal (from Example 1) in 4 mL of methanol were added 0.608 g (2 mmol) of 1-methane-sulfonyl-spiro(indoline-3,4'-piperidine) hydrochloride and 0.6 g of powdered 4 Å molecular sieves. After 15 min a solution of 0.554 g (8.8 mmol) of $NaCNBH_3$ in 8 mL of THF was dropwise added. Some gas evolution was observed. After 2 h, when the reaction was complete by TLC, the mixture was filtered through a pad of celite, the reaction flask and the pad were rinsed with methanol. The filtrate was concentrated to approximately 5 ml and the residue was partitioned between saturated $NaHCO_3$ and Et_2O:EtOAc. The organic layer was washed with water, brine and dried over Na_2SO_4. The filtrate was concentrated and the residue was chromatographed on a flash column using a gradient of 49:49:2 to 74:24:2 EtOAc:hexane: triethylamine to furnish 0.94 g (72%) of the title compound as a foam. ^1H NMR (CDCl3, ppm ranges are given because of amide rotomers and line broadening) δ 1.37 (s, 9H), 1.6-3.6 (m, 15H), 2.61 & 2.72 (2s, 3H), 2.86 (s, 3H), 3.74 (s, 2H), 6.95-7.4 (m, 7H).

Cold trifluoroacetic acid (TFA, 4 mL) and 0.2 mL of anisole were added to 0.94 g (1.57 mmol) of 1'-(3-(S)-(3,4-dichlorophenyl)-4-(N-(t-butoxycarbonyl)(methylamino))butyl)-1-methanesulfonyl-spiro(indoline-3,4'-piperidine) and the mixture was stirred in an ice bath until all the foam dissolved. After stirring the resulting solution at room temperature for 30 min, it was concentrated *in vacuo*. The residue was partitioned between 0.5 N NaOH and CH_2Cl_2 and the layers were separated. The organic layer was washed with brine, dried over Na_2SO_4

and concentrated to give 0.7 g of foam which was used in the next step without purification.

A solution of 0.12 g (0.52 mmol) of 3,5-dimethylbenzoic acid in 2 mL of CH_2Cl_2 containing 1 drop of DMF was treated with 85 ul of oxalyl chloride. (Caution-gas evolution!) After 20 min the solution was concentrated *in vacuo* and the residue was mixed with 0.2 g (0.4 mmol) of 1'-(3-((S)-(3,4-dichlorophenyl))-4-(methylamino)butyl)-1-methane-sulfonyl-spiro(indoline-3,4'-piperidine) obtained from Step A, and 0.14 mL (1 mmol) of Et_3N in 2 mL of CH_2Cl_2. After 1 h the reaction mixture was diluted with CH_2Cl_2 and washed with saturated $NaHCO_3$, water, and brine. The CH_2Cl_2 solution was dried over Na_2SO_4, filtered and concentrated. Purification of the residue by prep TLC using 2% Et3N/EtOAc afforded 0.238 g (93% yield) of the title compound as a foam.

EXAMPLE 4

1-Benzyloxycarbonyl-spiro(indoline-3,4'-piperidinium) hydrochloride

A solution of 99 g (489 mmol) of 1'-methylspiro(indoline-3,4'-piperidine) (prepared according to Ong, H. H. *et al*, J. Med. Chem., 1983, 26, 981-986) in 1 L of CH_2Cl_2 and 82 mL (539 mmol) of Et_3N was cooled to 0-5°C with an ice bath and 77 mL (539 mmol) of benzyl chloroformate was added over 30 min keeping the reaction temperature below 10°C. After stirring for 2 h 19 mL (136 mmol) of Et_3N and 15 mL (105 mmol) of benzyl chloroformate were added since the reaction was incomplete and stirred for 2 h. At this time, additional 19 mL (136 mmol) of Et_3N and 15 mL (105 mmol) of benzyl chloroformate were added. After 1 h, when a TLC indicated a complete reaction, the solution was concentrated *in vacuo* and the residue was partitioned between ether and saturated $NaHCO_3$. The layers were separated, the organic layer was washed with saturated $NaHCO_3$ and brine, and dried over $MgSO_4$. The filtrate was concentrated and the residue was chromatographed on 2 kg of silica gel using 1-5% MeOH/CH_2Cl_2 to obtain 117 g (71%) of 1-benzyloxycarbonyl-1'-methylspiro(indoline-3,4'-piperidine) as a yellow oil. The yellow oil was dissolved in 800 mL of 1,2-dichloroethane and cooled in ice bath as 50 mL (463 mmol) of 1-chloroethyl chloroformate keeping the temperature below 10°C. The resulting solution was heated to reflux. Gas evolution was noticed when the reaction temperature reached 70-75°C. After 1 h the solution was cooled, concentrated to ca. 250 mL *in vacuo* and 700 mL of methanol was added. The mixture was refluxed for 1.5 h and gas evolution was observed. The reaction was cooled to room temperature and concentrated *in vacuo* to a wet solid. The solid was slurried with cold methanol, the solid was filtered, washed with cold methanol and dried. The filtrates and the washing were combined and concentrated to a brown foam. The brown foam and the filtered solid were suspended in CH_2Cl_2, washed with 2.5 N NaOH and the CH_2Cl_2 solution was dried.

The residue was chromatographed on 2 kg of silica gel using a gradient of 94:5:1 to 89:10:1 CH_2Cl_2, methanol, NH_4OH to isolate 91.3 g of free base as a brown oil. The oil was dissolved in 1 L of EtOAc by adding methanol (ca. 10 mL) and HCl gas was passed through the solution. After stirring the acidic solution for 10 min, it was concentrated to a foam. The foam was triturated with ether and the solid was filtered, washed with more ether and dried to furnish 91.5 g (73%) of title compound as a light yellow solid.

1'-(3-((S)-(3,4-Dichlorophenyl))-4-(N-(3,5-dimethylbenzoyl)(methyl-amino))butyl)-1-acetyl-spiro(indoline-3,4'-piperidine)

1-Acetyl-spiro(indoline-3,4'-piperidine)

Acetyl chloride (1.4 mL, 19.9 mmol) was added to a solution of 5.35 g (16.6 mmol) of 1'-benzyloxycarbonyl-spiro(indoline-3,4'-piperidine) in 33 mL of CH_2Cl_2 and 3.2 mL (23.2 mmol) of Et_3N keeping the temperature between 0-5°C by cooling in ice bath. After 10 min the cold bath was removed and reaction was stirred for 30 min at which time a TLC indicated complete reaction. The solution was diluted with CH_2Cl_2 and washed with water, brine and dried over Na_2SO_4. The filtrate was concentrated to a thick oil and the oil was dissolved in 40 mL of EtOH. Acetic acid (3 mL) and 0.8 g of 10% Pd/C were added to the solution and the resulting mixture was hydrogenated on a Parr apparatus for 3 h. The catalyst was filtered and washed with EtOAc and the combined filtrate was concentrated. The residue was partitioned between CH_2Cl_2 and water and 2N NaOH was added to this mixture until the aqueous layer was basic. The layers were separated and the aqueous layer was extracted with CH_2Cl_2. The combined organic layer was washed with brine, dried over Na_2SO_4 and the filtrate was concentrated to give 2.93 g (77%) of the title compound sufficiently pure for use in the next reaction.

1'-(3-((S)-(3,4-Dichlorophenyl))-4-(N-(3,5-dimethylbenzoyl)(methyl-amino)) butyl)-1-acetyl-spiro(indoline-3,4'-piperidine)

To a solution of 0.284 g (0.75 mmol)of 3-((S)-(3,4-dichlorophenyl))-4-(N-(3,5-dimethylbenzoyl)(methylamino))butanal (Example 5) in 2 mL of MeOH were added 0.166 g (0.72 mmol) of 1-acetyl-spiro(indoline-3,4'-piperidine), 0.5 g of powdered 4 Å molecular sieves and 10 drops (ca. 0.1 mL) of acetic acid. After stirring the mixture for 1.5

h a solution of 0.189 g (3 mmol) of $NaCNBH_3$ in 3 mL of THF was added. Some gas evolution was observed. After 30 min when the reaction was complete by TLC the mixture was filtered through a pad of celite, the reaction flask and the pad were rinsed with MeOH. The filtrate was concentrated to approximately 3 mL and the residue was diluted with EtOAc. The EtOAc solution was washed with water, brine and dried over Na_2SO_4. The filtrate was concentrated and the residue was chromatographed on a flash column using 50% EtOAc-hexane followed by 2% Et3N-EtOAc and finally 93:5:2 EtOAc: MeOH: Et_3N to isolate 0.317 g (74%) of the title compound as a white foam.

After 30 min at -78°C, methyl phenyl sulfoxide (3.32 g, 23.7 mmol) in THF (4 mL) was added. The solution was warmed to 0°C and cooled back down to -78°C. 1-t-butoxycarbonyl-4-piperidinone (4.69 g, 23.7 mmol) in THF (20 mL) was added. The reaction was warmed to room temp, quenched by addition of solid NH_4Cl, concentrated in vacuo, and partitioned between H_2O (100 mL) and EtOAc (100 mL). The organic layer was washed with H_2O (50 mL) brine (50 mL), dried ($MgSO_4$), and concentrated in vacuo. The resultant oil was heated at 80°C in t-butanol (50 mL) with potassium t-butoxide (3.4g, 30 mmol) for 2 h. Solid NH_4Cl was added, and the reaction was concentrated in vacuo and partitioned between H_2O (100 mL) and EtOAc (100 mL). The EtOAc was washed

with brine (50 mL), dried ($MgSO_4$), concentrated in vacuo and purified by column chromatography (silica gel 60, 0-50% EtOAc/hexane) to yield 4.47 g (79%) of the title compound as a crystalline solid. ^1H NMR (400 MHz, DMSO-d_6) δ 5.21 (d,1H), 4.96 (s, 1H), 4.77 (s, 1H), 3.82 (t, 2H), 3.67 (dt, 1H), 2.83 (dt, 1H), 2.77-2.50 (brd d, 1H), 2.26 (dt, 1H), 2.01 (ddd, 1H), 1.38 (s, 9H) ppm.

EXAMPLE 72

1-Acetyl-1'-(3-((S)-(3,4-dichlorophenyl))-4-(N-t-butoxycarbonyl)-(methylamino))butyl)-5-fluoro-spiro(indoline-3,4'-piperidine)

To 1'-(3-((S)-(3,4-dichlorophenyl))-4-(N-t-butoxycarbonyl)-(methylamino))butyl)-5-fluoro-1-methanesulfonyl-spiro(indoline-3,4'-piperidine) (1.32 g 2.15 mmol) in toluene (5 mL) at 0°C was added 3.4M

Red-Al/toluene (5.1 mL, 17.2 mmol). After 4 h at room temp, the reaction was cooled to 0°C and quenched by cautious addition of 1N aqueous NaOH (2 mL). Cold saturated aqueous sodium potassium tartrate (30 mL) was added, and the biphasic mixture was mechanically stirred at 0°C for 1 h. The product was extracted with toluene (3 x 10 mL), washed with 50% saturated aqueous sodium potassium tartrate (10 mL), H_2O (10 mL), brine (10 mL), dried ($MgSO_4$), and concentrated to roughly 5 mL volume, and cooled to 0°C. Pyridine (705 µL, 8.6 mmol) and acetic anhydride (410 µL, 4.3 mmol) were added. After 16 hours at room temp, the reaction was concentrated and purified by column chromatography (silica gel 60, 0-50% acetone/CH_2Cl_2) to yield 830 mg (72%) of the title compound as a white foam. ^1H NMR (400 MHz, $CDCl_3$) δ 8.14 (dd, 1H), 7.37 (d, 1H), 7.28 (m, 1H), 7.1-7.0 (m, 1H), 6.87 (m, 2H), 3.95, 3.81 (rotamer singlets, 2H), 3.53 (m, 1H), 3.36 (m, 2H), 3.22 (m, 1H), 3.01 (m, 1H), 2.90 (m, 1H), 2.82 (m, 1H), 2.74, 2.63 (rotamer singlets, 3H), 2.39, 2.20 (rotamer singlets, 3H), 1.89 (m, 4H), 1.65 (m, 4H) ppm.

1'-(3-(R)-(3,4-Dichlorophenyl)-5-(N-3,5-dimethylphenyl-methylamino)-5-oxo-pentyl)-1-methanesulfonyl-spiro(indoline-3,4'-piperidine)

Step 1) Diazomethyl-(2-(S)-(3,4-dichlorophenyl)-pent-4-en-yl)-ketone.

To a solution of 2-(S)-(3,4-dichlorophenyl)-pent-4-enoic acid (5.04g, 20.6mmol) in 60mL of dichloromethane was added oxalyl chloride 2.15mL (24.6mmol) and dimethylformamide (0.1mL) upon cooling in an ice-water bath. The cooling bath was then removed and the reaction mixture was stirred at rt overnight. The solvent was removed under reduced pressure. The resulting material was diluted in ethyl acetate and concentrated in vacuo in order to remove residual HCl. The residual crude acid chloride was dissolved in 70mL of ether and was slowly added to a 100mL ether solution of diazomethane (77mmol). After stirring for 2hr at rt, the solvent was removed under vacuum. The resulting yellow oil was chromatographed on silica gel column eluting with a gradient of hexane:ethyl acetate = 20 : 1 to 3 : 1 to give 4.66g (84%) of diazomethyl-(2-(S)-(3,4-dichlorophenyl)-pent-4-en-yl)-ketone. ^{1}H-NMR ($CDCl_3$ 400MHz): δ 2.44(app. quint. 1H), 2.82(app. qunit. 1H), 3.43(br s. 1H), 4.98 & 5.02 (d of AB quart., 2H), 5.16 (br s, 1H), 5.63(m, 1H), 7.09 (dd, J=2.2Hz, 8.3Hz, 1H), 7.34(d, J=2.2Hz, 1H), 7.38 (d J=8.3Hz).

The aqueous layer was extracted with 3 x 50 mL of ethyl ether and the combined organic layers were washed with 50 mL of brine, dried over sodium sulfate and concentrated. The residue was purified by flash column chromatography on silica gel, eluting with 20-40% dichloromethane in hexane. Additional purification by flash column chromatography on silica gel, eluting with 5% ethyl ether in hexane gave 897 mg of the title compound as an amber oil. ^{1}NMR (400 MHz, $CDCl_3$): δ 7.36-7.30 (m, 3H), 7.25-7.21 (m, 2H), 5.78 (ddt, 1H, J = 17, 10, 7 Hz), 5.21 (bd, 1H, J = 10 Hz), 5.20 (dq, 1H, J = 17, 1 Hz), 3.84 (t, 1H, J = 7 Hz), 2.70-2.57 (m, 2H). Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☒ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING
This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

Group I, claims 1-9, drawn to method of modulating chemokine receptor activity.
Group II, claims 10-17, drawn to method of preventing, treating HIV infection or delaying onset or treating AIDS.

Group III, claims 20-21, drawn to benzothiopenyl spiro compounds.

The inventions listed as Groups I, II and III do not relate to a single inventive concept under PCT Rule 13.1 because the method for group I and for group II are not related. Under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons:

The method of modulating a biological receptor comprises administering to a mammal in need thereof a receptor affinity effective amount of a known compound of claim 1.

The method of preventing, treating HIV infection or delaying onset or treating AIDS comprises administering to a "patient" an antiviral or therapeutical effective amount of a known compound of claim 10.

The subject, dosage and conditions being ameliorated in group I or group II are independent and distinct from each other without any cause/effect relationship. Therefore, the two process of using the products are independent inventive concepts for which independent searches are required.
